Week 2 — Hands-On with Basic Security Tools

Program: Vortex Tech Academy Cybersecurity Internship
Week: 2 of 4
Status: Learning tasks completed

Overview

This folder documents my Week 2 hands-on learning with basic security tools.

Project 1 — Python Password Strength Checker

A beginner-level Python command-line program that evaluates sample passwords using basic validation rules.

What I practiced:

- Password length checks
- Uppercase and lowercase letters
- Numbers and special characters
- Common-password detection
- Weak, Medium, and Strong ratings
- Feedback and sample testing
- Hidden terminal input using Python's `getpass`

Project files: `password_checker.py` and its README.

Project 2 — Nmap Port Scanner

A basic Nmap exercise performed against my own Ubuntu localhost.

What I practiced:

- Localhost scanning using `127.0.0.1`
- Understanding open, closed, and filtered port states
- Service detection using `-sV`

Saving scan output

Documenting findings and potential security impact

Project files: `nmap-localhost.txt`, `nmap-services.txt`, and `nmap-findings.md`, where available.

Key Learning Outcome

Improved my foundational understanding of Python, password security, Linux, network ports, service identification, testing, and technical documentation.

Security and Safety

Use sample passwords only; never publish real passwords or credentials.

Scan only systems you own or have explicit permission to test.

An open port is not automatically a vulnerability.

These projects are educational exercises, not production-grade security tools.
